THE CORRUGATION

Corrugation is a particular processing applied on plain tubes to induce dynamic turbulence during the liquids flowing allowing thermal exchange optimization.

With corrugated tubes the thermal exchange efficiency can be enhanced by 40% up to 90% according to the following parameters:

- type of product
- selected profile
- type of application

ADVANTAGES

- reduced exchange surfaces
- reduced contact and standing product time inside the element
- reduced washing time thanks to a higher action produced by turbulence
- vertical or horizontal installation
- working possibilities with high pressures and temperatures
- gaskets-free design so lower maintenance costs
- easy to install and exchanger modularity

MULTIFLO Heat Exchanger consists of small diameter corrugated tubes fitted inside an external jacket and welded on tube plates at end sides. MULTIFLO is a multipassage / many passages heat exchanger and tubes side backflow is allowed by special heads.

An expansion joint is fitted on external jacket. The product to be thermally processed flows inside small diameter tubes while service fluid flows inside the (external) jacket.

MULTIFLO Heat Exchanger is fully welded.

Application range

Particularly suited for thermal exchange process of industrial products having a low or medium viscosity even with particulates.

Standard materials

Stainless steel AISI 304 / 316 L
(Other kind of materials are available on request)

Standard pressure project

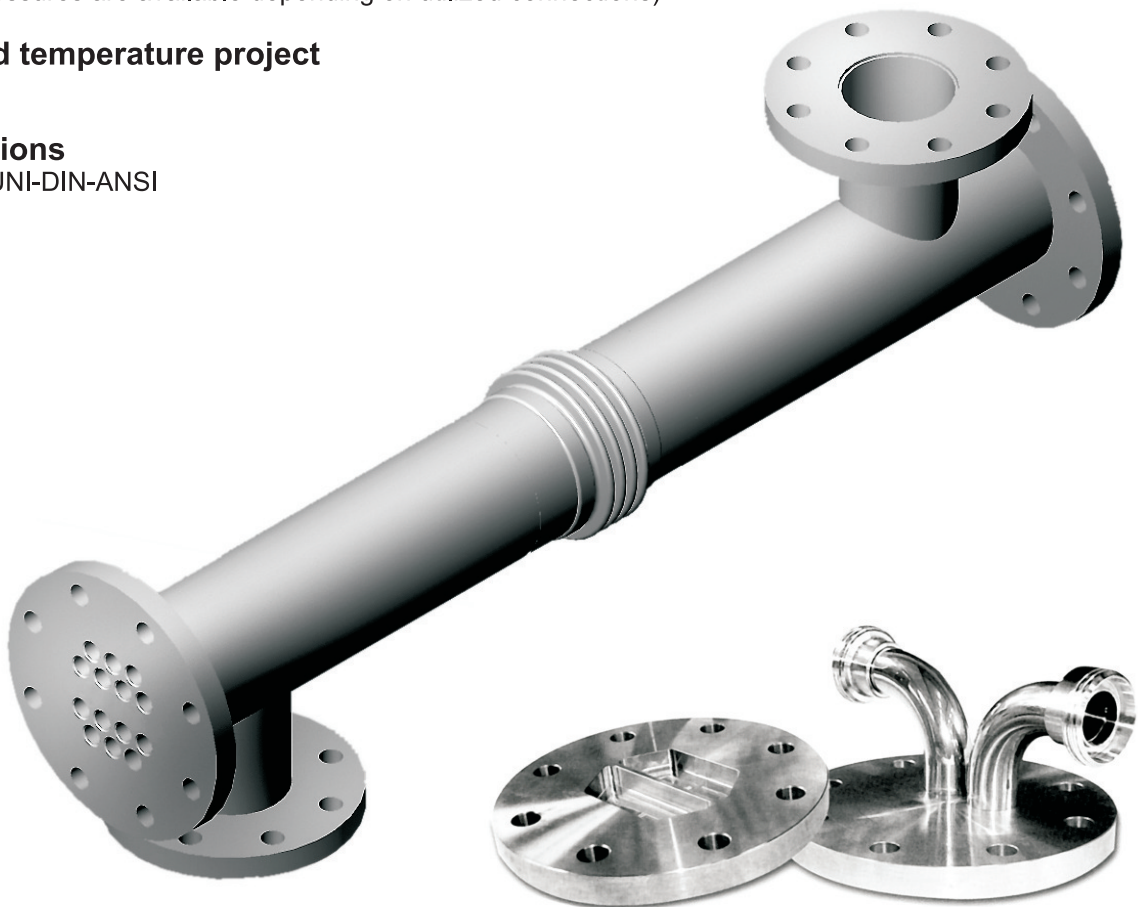

10 bar
(Higher pressures are available depending on utilized connections)

Standard temperature project

184° C

Connections

FLANGE UNI-DIN-ANSI
